Timeline of Organic Chemistry

- **Berzelius Theory (1815):**
  (Vital Force Theory)

Acc^n to it, it was assumed that organic compounds are obtained only from plants and animals, which means that it cannot be synthesized in laboratory.

Above theory was proved wrong by Wohler's synthesis.

- **Wohler's Synthesis (1828):**

$NH_4^+ \; N\equiv C-O^-$ $\quad NH_4CNO \xrightarrow{\Delta} NH_2CONH_2$

Ammonium cyanate $\quad$ Urea (organic cpd.)

- **What are Organic compounds?**

Compounds containing carbon with the exception of oxides, carbides, carbonates, cynides.

- **Why carbon is so special?**

It is due to special ability of carbon atom to form long chains containing C-C and other bonds known as catenation.

- Tendency for catenation decreases down the group because orbitals

ATPSTAR, Gopal Square 3rd Floor, 89-90 Shrinathpuram, Sec.-A, Kota, Rajasthan 324010 Website : http://www.atpstar.com

* Bicyclo & Spiro compounds :→

- SPIRO is a Bicyclo compound having 1 common atom b/w two rings.

SPIRO
↓
SPIRA
↓
TWIST

- Fused Bicyclo compounds have two common atoms between the rings.

(Homocyclic)

} Fused

Downloaded From www.jeebooks.in

www.jeebooks.in

- Bridged bicyclo compounds have atleast three common atoms. Those common atoms form a bridge.

* Degree of Carbon & Hydrogen :→

- 1° carbon ⇒ Primary / P ⇒ It is directly attached to 1 carbon.
  (If not attached to any still use it)
- 2° C ⇒ Secondary / S ⇒ directly to 2 carbons
- 3° C ⇒ Tertiary / T ⇒ directly to 3 carbons
- 4° C ⇒ Quaternary / Q ⇒ directly to 4 carbons

www.jeebooks.in

⟹

1°	2°	3°	4°	
5	1	1	1	C
15	2	1	0	H

- Degree of H depends on degree of Carbon to which it is attached
- Quarternary H is not possible & H connected to Heteroatoms does not have any degree.

16]

- Homocyclic compounds : Rings are formed only using carbon. Also called carbocyclic.

eg:

- Heterocyclic compounds : Rings contain atleast one other atom (than C)

eg:

Pyridine, Furan, Thiophene, Quinoline, Pyrrole

www.jeebooks.in

* Classification of Organic Compounds :→

- Aliphatic
  - Open chain (acyclic)
    - Saturated
    - Un.S.
  - Closed Chain (alicylic)
    - Saturated
    - Un-S.
- Aromatic
  - Homocyclic
    - (conjugation)
    - (Naphthelene)
    - (Anthracene)
  - Heterocyc
    - (Furan)
    - (Pyridine
    - (Thiopher

* Common Names (Trivial name) :→

These names are based on the origin of the compound or it may be historical reason

- → Formic acid
- → Formaldehyde
- → Methyl Formate

www.jeebooks.in

- → Formamide
- → N, N - Dimethyl Formamide (DMF)
- $CH_3-\overset{O}{\overset{\|}{C}}-OH$ → Acetic Acid
- $CH_3-\overset{O}{\overset{\|}{C}}-H$ → Acetaldehyde
- $CH_3-\overset{O}{\overset{\|}{C}}-CH_3$ → Acetone
- CH_3-CH_2-COOH → Propionic acid

* IUPAC Naming :→

- Why it is needed ?

→ As there are lakhs of compounds some standard rules were needed to name them and these rules were summarized by IUPAC.

- General Scheme of IUPAC naming :-

$\underbrace{\text{Mr.}}_{\text{Prefix}}$ $\underbrace{\text{Chunnu}}_{\text{Word Root}}$ $\underbrace{\text{Lal}}_{\text{Suffix}}$

⇒ Prefix Word Root Suffix

www.jeebooks.in

- **Word Root** : It tells us about number of carbon in the parent chain (Principal chain)

No. of Carbon	Word Root
1	Meth
2	Eth
3	Prop
4	But
5	Pent
6	Hex
7	Hept
8	Oct
9	Non
10	Dec
11	Undec
12	Dodec
13	Tridec
⋮	⋮
20	Eicos
⋮	⋮
30	Triacont
⋮	⋮
100	Hect
⋮	⋮
123	Trieicoshect

www.jeebooks.in

- 1° Suffix : It tells us about presence of saturation / unsaturation in a compound.

→ Prop ane
W.R. 1°S

→ Prop ene
W.R. 1°S

→ Prop yne
W.R. 1°S

- 2° Suffix : It tells us about principal functional group in a given compound.

→ Ethanol
Eth + ane + ol
WR 1°S 2°S

a, e, i, o, u, y

→ Propanamine
WR 1°S 2°S

→ Butanal
WR 1°S 2°S

- 1° Prefix : It tells us whether parent chain is cyclic or not.

→ cyclopropane
1°P WR 1°S

www.jeebooks.in

→ Cyclobutanol
1°P WR 1°S 2°S

→ Cyclohexanamine
1°P WR 1°S 2°S

• 2° Prefix : It tells us about locants present in the parent chain. Few functional are always treated as locants.

eg: $-F$, $-Cl$, $-Br$, $-I$ ⇒ Floro, Chloro, Bromo, Iodo
$-NO_2$, $-NO$, $-ONO$ ⇒ Nitro, Nitroso, Nitrito
$-OR$ ⇒ Alkoxy
- Junior f. gp.

→ 2-Chloro butane
2°P

→ 2-Nitro butane
2°P

Q.

→ 4-Chloro cyclo hex-2-enol
2°P 1°P WR 1°S 2°S

www.jeebooks.in

• Rules :→

a) How to select the principal chain ? (In Alkanes)

- Select the longest chain ~~having maximum no. of locants~~.
- If multiple chains have same c-atoms then select the one having more no. of locants.

eg : •

•

•

•

Q. Select the principal chain among following :

a)

b) $CH_3CH_2CH_2C(=CH)-CH_2CH_3$
CH_3 CH_3

c) $CH_3CH_2CH_2CH_2CH_2C(CH_2)_2C(CH_3)_3)(CH_2CH_2CH_2CH_3)(CH_2CH_2CH(CH_3)_2)$

e)

d) $(CH_3(CH_2)_3C(CH_2)_2C(CH_3)_3)-(CH_2)_3CH_3$

www.jeebooks.in

b) Numbering :→

- It is done from the corners.
- It is done in such a way that locant receives lowest number (lowest locant rule)

2-chloropentane

3-Bromo-2-chloropentane

- If ~~the~~ numbering is same from both sides use alphabetical order
- Write the locants in alphabetical order
- In case of multiple locants of same type you should use di, tri, tetra, etc. (do not consider these prefixes in A.O.)

2-Bromo-4-chloropentane

4-Bromo-2,2-dichloro pentane

2-Bromo-3,3-dichloropentane

www.jeebooks.in

Q.

1)

⇒ 1-Bromo-6-chloromethyl-4,4-diethyl-2-methyl octane.

2)

⇒ 2-Bromo-3-Chloro-~~NO2~~-4-propyl ~~methyl~~-7-floro-6-Nitrose Dodecane

Complex substituents

P.C.		Common Name	IUPAC
	-Iso	Isopropyl	1-methyl ethyl
	-Iso	Isobutyl	2-methyl propyl
	-secondary (-sec)	sec. butyl	1-methy proph
	-Tertiary -tert./-t	-t butyl	1,1-dimethy ethyl
	-Neo	-Neopentyl	2,2-dimethyl propyl

- consider iso, neo in alphabetical order. Also consider di, tri present in the complex substituents.
- In case, complex sub. appears multiple times then use di, tri when common name is used and Bis, tris,

www.jeebooks.in

Q.

1)

⇒ 7-Sec.butyl-9-(t-butyl)-4-Isopropyl-5-Neopentyl TriDeca

2)

⇒ 4,7-diisopropyl undecane

OR

4,7-bis(1-methyl ethyl) undecane

*3)

5-Bromo-10-(t-butyl)-9-Chloro-2,3-diethyl-6-floro-7-Hexyl-4-Iodo-11-Nitro tridecane

www.jeebooks.in

* Naming of Alkenes

- Select the longest chain containing max. no. of Alkenes.

4-Bromo pent-2-ene

OR

4-Bromo-2-pentene

4-Bromo-2-chloro hex-3-ene

2-Bromo-5-chloro-3-hexene

Penta-1,3-diene

6-Bromo-7-chloro-1,3,5-Heptatriene

www.jeebooks.in

Q.

⇒ 5 - isopropyl hepta-1,3,5-triene.

Q.

⇒ 2-Bromo-1,1-dichloro ethyl

⇒ 8-(2-Bromo-1,1-dichloro ethyl)-10-(n-butyl)-Chloro-5-isobutyl-4-isopropyl-3(-2-Nitro propyl) Undeca-1,5,9-triene

* Alkynes :→

$HC \equiv CH$

⇒ Ethyne (Acetylene)

⇒ Propyne

⇒ 2-Butyne

⇒ 2-Pentyne

⇒ Hexa-2,4-diyne

⇒ 3-methylidene penta-1,4-diene

⇒ 3-Ethenyl Hexa-1,4,-diene

www.jeebooks.in

Q. a)

⇒ Hex-4-en-1-yne

b)

⇒ Hept-2-en-5-yne

* Select the longest chain containing max. no. of Alkenes / Alkynes.
* In case of tie, prefer Alkene.

c)

⇒ 4-Ethenyl Hept-2-en-5-yne

d)

⇒ 10-(2-Bromo prop-2-ene)-7-(t-butyl)-

www.jeebooks.in

* Cyclic compounds :→

Case I : When open chain contains more carbon in parent chain than the cyclic. 'c' of cyclo will be used / considered in A.D.

⇒ 2-Cyclopropyl Butane

⇒ 2-Bromo-3-cyclobutyl Pentane

⇒ 1-sec. butyl cyclopropene

⇒ 3-(1-ethyl propyl) cyclopropene

⇒ 3-(2-Bromo-3-chloro-prop-2enyl) Hepta-5-en-1-yne

www.jeebooks.in

⇒ 5 - (4-Bromo cyclobut-2-enyl) - 7 - (2-cyclopropyl cyclopropyl) - 6 - Ethynyl Nona 2, 4, 7 - triene

Case - II

⇒ Propyl cyclopropane

⇒ Isopropyl cyclopropane

⇒ 3-(1-methyl ethenyl cyclopropane)

Case - III

⇒ 1-Bromo-3-chloro cyclohexane

⇒ 3-Bromo-1,1-dichloro cyclohexane

⇒ 1,6-dimethyl cyclohexene

⇒ 3-Isopropyl-1-methyl-hexa-1,3-diene

www.atpstar.com

www.jeebooks.in

Q.

3-Bromo-4-chloro cyclobut-2-enyl

⇒ 1-(3-Bromo-4-chloro cyclobut-2-enyl) - 2(2-Bromo-1-Methyl ethyl) - 3 - t-butyl - Hexa-1,4-diene

Q.

2-Bromo-3-cyclopROP-zenyl cyclopropyl

1-chloro prop-2-enyl

⇒ 2-(2-Bromo-3-cyclopROP-2-enyl cyclopropyl) 3-(1-chloro prop-2-enyl) Hexa-1,3-diene

* Nomenclature of Functional group :→

Priority Table

Functional group	2° Prefix	2° suffix
1. —COOH	carboxy	oic acid

17.

⇒ 2-Bromo-3,4-epoxy pentanamide

18.

⇒ 3-Ethenyl-4-Ethynyl-5-methylidene cyclohexanol

19.

⇒ 6-Bromo cyclo hex-3-enol

20.

⇒ 3-amino-5-mercapto cyclohexanol.

* Specific Rule (1993) : If three or more same carbon containing terminal functional groups are directly attached to an unbranched alkane then alkane is considered the parent chain and the following suffixes are used,

- $-COOH$ carboxylic acid
- $-CHO$ carbaldehyde
- $-COOMe$ carboxylate
- $-CN$ carbonitrile
- $-COX$ carbonyl halide
- $-CONH_2$ carboxamide

www.jeebooks.in

1.

⇒ propane-1,2,3-tricarboxylic acid

2.

⇒ Butane-1,2,4-tri carbaldehyde

3.

⇒ trimethyl pentane-1,3,5-tricarboxylate

4.

⇒ Hexane-2,3,5-tricarbonitrile

5.

⇒ Pentane-1,2,4-tricarbonyl chloride

6.

⇒ Propane-1,2,3-tricarbox amide

Note: If carbon containing terminal F.G. is directly attached to ring then also the above suffixes are used.

1.

⇒ cyclohexane carbonylic acid

2.

⇒ 2-Bromocyclopentane carbaldehyde

www.jeebooks.in

3.

⇒ Methyl cyclobutane carbonylate

4.

⇒ Cycloprop-2-ene carbonitrile

5.

⇒ 4-hydroxy cyclo hex-3-ene carbonyl chloride

6.

⇒ Cyclopentane carboxamide

7.

⇒ 3-amino-5-hydroxy cyclo ~~pentanal~~ Hexa carbaldehyde

8.

⇒ 6-Formyl-5-~~Hydro~~ chloro carbonyl cyclo hex-2-ene carbonylic acid

9.

⇒ Ethyl-2-Bromo carbonyl-5-carbamoyl cyclo hexane carboxylate

10.

2. Naming of cyclic compounds (Aliphatic)

3. Use of common names

www.atpstar.com

www.jeebooks.in

2. General Organic Chemistry

* Electronic displacement effects :→

Permanent

- Inductive effect (I)
- Resonance / Mesomeric (M) effect
- Hyperconjugation (H)
- Field Effect (F)

Temporary

- Electromeric effect (E)
- Inductomeric effect (IM)

1. Inductive Effect (I) :→

→ It is permanent polarisation of 'c' chain as a result of displacement of sigma (σ) es-

→ It is a weak effect

→ It decreases with increase in distance from EN atom

→ It can be neglected after 3 'c' atoms.

eg: •

•

•

• There are two types of groups showing I-effe

- I-effect of H-atom is assumed to be zero. So I-effect of other groups is measured relative to hydrogen

www.jeebooks.in

- groups showing +I have greater e^- releasing capability relative to 'H'.
- groups showing −I have greater e^- withdrawing capability w.r.t 'H'.
- this effect is relative and not absolute.

Q. Identify +I / −I

a)

b)

c)

d)

e)

f)

g)

h)

i)

www.jeebooks.in

j)

k)

l)

m)

n)

o)

Q. compare +I :→

a)

+I increases as "pipelines" ↑.

$CH_3 \rightarrow CH_2 \rightarrow CH_2 \rightarrow Cl$

b)

} less EN.

c) CH_3-CH_2Cl <

d) $>C-T$

+I decreases ↓

$>C-D$

$>C-H$

Heavier isotopes form stronger bonds coz of lesser vibrational frequency and stronger overlapping.

B.S. order ⇒ C–T > C–D > C–H

B.L. order ⇒ C–H < C–D < C–T

www.jeebooks.in

e) $-CD_3$, $-CT_3$, $-CH_3$ } $b > a > c$.

f) $-O^-$, $-NH^-$, $-CH_2^-$, $-\overset{O^-}{\overset{|}{C}}=O$ ← Partial -ve hence least

$d < a < b < c$. } EN.

Q. Compare "-I" :-

a) $-F > -Cl > -Br > -I$

b) $-OH > -OR$

c) $-NO_2 > -CN$

d) $-\overset{O}{\overset{\|}{C}}-OH > -\overset{O}{\overset{\|}{C}}-NH_2$

e) $-\overset{O}{\overset{\|}{C}}-H > -\overset{O}{\overset{\|}{C}}-R$

f) $-\overset{O}{\overset{\|}{C}}-OH > -\overset{O}{\overset{\|}{C}}-OR$

g) $-C\equiv CH \not> -CH=CH_2$

h) $-CH=CH_2 <$

i) $-C\equiv N \not> -CH=NH$

www.jeebooks.in

j) $-\overset{O}{\overset{\|}{C}}-Cl > -\overset{O}{\overset{\|}{C}}-OCH_3 > -\overset{O}{\overset{\|}{C}}-NH_2 \Rightarrow a > b > c$

l) $-\overset{\oplus}{N}R_3 > -\overset{\oplus}{N}H_3 > -\overset{\oplus}{N}H_2R > -\overset{\oplus}{N}HR_2 \Rightarrow$ * Solvent! (H-bonding)

Downloaded From www.jeebooks.in

* **-I order :→**

$-NF_3^+ > -NR_3^+ > -NH_3^+ > -NO_2 > -SO_3H > -CN$

$> -\overset{O}{\overset{\|}{C}}-H > -\overset{O}{\overset{\|}{C}}-R > -\overset{O}{\overset{\|}{C}}-OH > -\overset{O}{\overset{\|}{C}}-OR > -\overset{O}{\overset{\|}{C}}-NH_2$

$> -F > -Cl > -Br > -I > -OH > -OR > -C\equiv CH >$

$-Ph > -CH=CH_2 > -H$.

* **Terms used in Organic Reaction :→**

Types of Intermedia
→ carbcation / C^+
→ carbanion / C^-
→ Free radical / $\dot{C}$
→ Nitrene
→ Carbene, Benzyne

• **Intermediates:** are highly unstable species which are formed during a reaction.
They can be isolated but only under extreme conditions.

www.jeebooks.in

* Types of Bond Breaking :→

i] Heterolytic B.B. :→ When after B.B. e^- are shared unequally

$$A^{\delta+} - B^{\delta-} \longrightarrow A^+ \quad B^-$$

eg : • $CH_3-CH_2-Cl \longrightarrow CH_3CH_2^+ \quad Cl^-$

↓ carbocation (octet incomplete)

• $\longrightarrow$ Cl^-

↓ carbocation

• $CH_3\overset{\delta-}{C}H_2 - \overset{\delta+}{M}gX \longrightarrow CH_3CH_2^- \quad \overset{+}{M}g\,X$

↓ carbanion (Excess e^-)

* Carbocation : It is +vely charged 'c' having incomplete octet. It is sp^2 hyb. with planar shape.

Electron donating grps showing +I will stabalise C^+.
Electron withdrawing grps showing −I will destabalize C^+.

* Carbanion : It is −vely charged electron rich 'c'. Trigonal pyramidal (sp^3). Electron withdrawing grps showing −I will stabalize carbanion

www.jeebooks.in

ii] Homolytic B.B. : It is favourable in non-polar or slightly polar bonds. It is highly favourable in presence of light.

• Free radical is e^- deficient atom having unpaired electron.

$$A - A \xrightarrow[\text{light}]{h\nu} 2(\dot{A})$$

eg : • $Cl - Cl \longrightarrow 2\,\dot{Cl}$

• $R - \ddot{O} - \ddot{O} - R \longrightarrow 2\,R\dot{O}$

• $H_3C - CH_3 \longrightarrow 2\,\dot{C}H_3$

{ Angle strain }

www.jeebooks.in

* RESONANCE :→

· Why Resonance concept is needed ?

→ It is a theortical concept which is used to explain various properties such as bond length, e^- density which cannot be explained by conventional structures.

· What is Resonance ?

→ Resonance is delocalisation of π electrons. It occurs only on paper.

- Structures drawn in the process are known as resonating structures / canonical structures / contributing structures.
- Real structure is Resonance hybrid which is formed by mixing R.S.
- Contribution of R.S. $\propto$ Stability

eg,

· Formate ion,

Resonating structures R.S
(Canonical structures)

www.jeebooks.in

• Carbonate ion,

b=c>a ✗
b=c=a ✓

{equivalent R.S}

- Resonance is a strong & permanent effect coz it operates thru π-bond

* Conditions for Resonance :→

1] Conjugation :

(Alternate positions)

,

,

,

,

2] Planarity :

→ No resonance as vacant orbitals are not in same plane.

www.jeebooks.in

C-1 : When π-bond is in conjugation with vacant p-orbital.

a)

} equi. R.S.

b)

c)

Benzyl Cation

d)

www.jeebooks.in

e)

f)

g)

h)

i)

NO RESONANCE

www.jeebooks.in

j)

Note : Octet Rule should not be violated during resonance.

C-2 : When π-bond is in conjugation with free radical.

- Break π-bond in homolytic manner
- In R.S. no. of unpaired e^- must remain same

a) $CH_2 = CH - \dot{C}H_2 \longleftrightarrow \underbrace{\dot{C}H_2 - CH - \dot{C}H_2}_{\text{unstable}} \longleftrightarrow \dot{C}H_2 - CH = CH_2$

$$\left[\overset{\delta\cdot}{CH_2} \cdots CH \cdots \overset{\delta\cdot}{CH_2} \right]$$

b)

www.jeebooks.in

C-3 : d-orbital Resonance

⇒ When l.p. is in conjugation with vacant d-orbital

$CH_2=Cl^- \longleftrightarrow \bar{C}H_2 \to Cl > \bar{C}H_2 \to F$

$[\overset{\delta-}{C}H_2 \cdots \overset{\delta-}{Cl}]$

$CCl_3O^- < CF_3O^-$

(∵ No conjugation b/w l.p. & vacant d-orbital)

C-4 : O.C.C$^+$ l.p. in conjugation with vacant p-orbital

This type of resonance is highly effective in stabalising carbocation coz octet gets completed during the process.

$\overset{+}{C}H_2 - OH \leftrightarrow CH_2 = \overset{+}{O}H$

$[\overset{+\delta}{C}H_2 \cdots \overset{+\delta}{O}H]$

$\overset{+}{C}H_2 - NH_2 \leftrightarrow CH_2 = \overset{+}{N}H_2$

$[\overset{+\delta}{C}H_2 \cdots \overset{+\delta}{N}H_2]$

(Acylium)

$R-\overset{+}{C}=O \leftrightarrow R-C\equiv O^+$

$[R-\overset{\delta+}{C} \cdots \overset{\delta+}{O}]$

d) → A A

Pentalene

www.jeebooks.in

e)

Azulene

f)

Quasi - Aromatic

g)

Benzyne

⇓

is aromatic but it is highly unstable becoz of very weak π-bond.

* <u>Azulene</u> :

- Why organic compds are coloured due to extended conjugation ?

→ Due to overlap b/w large no. of p-orbitals, gap b/w HOMO & LUMO decreases so, e^- transition will lie in visible spectrum.

* <u>Quasi Aromatic</u> : Aromatic as well as ionic compounds. They will show properties of ionic compounds. Charge (l.p.) is the part of aromaticity, so, the delocalisation is highly effective.

www.jeebooks.in

* **Rotational Barrier** : is amt. of energy needed for rotation across a given bond (per mole). It is very low for a sigma bond & very high for π-bonds.

* **Annulene** : conjugated monocyclic polyenes

* Theory of Acid / Bases :→

• Arrhenius

→ Acids donate H^+ & bases donate OH^-

HCl, HF, $HClO_4$, H_2SO_4 } Acids (donate H^+)

$NaOH$, KOH, $Mg(OH)_2$, $Ca(OH)_2$ } Bases (donate OH^-)

• Lewis

→ Lewis base donates e^- pair ; Lewis acid accepts that e^- pair.

www.jeebooks.in

• Bronsted - Lowry concept

→ It is based on the proton donation / acceptance

$$K^{+}\overset{\ominus}{O}H^{-} \cdots H^{\delta+}-Cl^{\delta-} \longrightarrow H_2O + Cl^-$$

Accepts H^+ (Proton) — Donates H^+ (Proton) — C. Acid — Conjugate base

- Acid Proton Donor (APD) — (HCl, Cl^-) CAB Pair
- Base Proton Acceptor (BPA) — (OH^-, H_2O) CAB Pair

Q. Draw C. Base

i) $H-O-H \xrightarrow[-H^+]{} OH^-$

ii) $H_3O^+ \xrightarrow[-H^+]{} H_2O$

iii) $R-\overset{+}{O}(H)-H \xrightarrow[-H^+]{} ROH$

iv) $R-OH \xrightarrow[-H^+]{} RO^-$

v) $R-\overset{+}{N}H_3 \xrightarrow[-H^+]{} RNH_2$

★ Remove hydrogen which is attached to most EN atom

Q. Draw C. acid

i) $\bar{O}H \rightarrow H_2O$

ii) $RO^- \rightarrow ROH$

www.jeebooks.in

iii) $RNH_2 \longrightarrow RH_3\overset{+}{N}$

iv)

v) $RCOO^- \longrightarrow RCOOH$

vi)

vii)

viii)

ix)

• K_a, pK_a, acidic strength :→

→ A strong acid is able to release more amt. of H^+ in the aq. sol^n

→ Acidic strength is a thermodynamic property.

$$\underbrace{H-A}_{\text{Acid}} + \underbrace{H_2O}_{\text{Base}} \overset{K_a}{\rightleftharpoons} \underbrace{H_3O^+}_{\text{C. Acid}} + \underbrace{A^-}_{\text{C. Base}}$$

$$K_a = \frac{[H_3O^+][A^-]}{[HA]}$$

www.jeebooks.in

$K_{a_1} = 10^{-7} < K_{a_2} = 10^{-5}$

$pK_{a_1} = -\log 10^{-7} > pK_{a_2} = -\log 10^{-5}$

$= 7 \qquad = 5$

So,

$$\boxed{A.S. \propto K_a \propto \frac{1}{pKa} \propto \underset{(C.\ Base)}{\text{Stability of } A^-} \propto \underset{(-I,\ -m)}{E.W.G} \propto \frac{1}{\underset{(+I,\ +m,\ +H}{E.D.G}}}$$

Q. Compare A.S.

14) C_8H_{10} (Benzene cont.) →

(4)

15) C_7H_8O (Phenols) →

(3)

16) $C_2H_4O_2$ (cyclic) → 1

(4)

Q. How many different structures are formed when one of the hydrogen in diphenyl methane is replaced with deuterium.

→ $Ph-CH_2-Ph$

(4)

www.jeebooks.in

* Tautomerism :→ It is a type of functional isomerism.

• Two isomeric forms interconvert in the presence of suitable catalyst.

In the given case, keto & enol forms are in equilibrium.

- Interconversion can be done in basic as well as acidic medium

• Base catalysed tautomerism ($\bar{O}H$)

• Acid catalyed tautomerism (H^+)

www.jeebooks.in

· Condition for Tautomerism :→

i) At least one α-H must be present in ketone

* PMR : Principle of microscopic reversibility.
In a reversible rxn, intermediates are same in forward as well as backward direction.

Compound which will not show tautomerism,

(unstable -ve charge on c-atom)

Q. Draw enol form(s) (if any)

www.jeebooks.in

www.jeebooks.in

*

*

* Comparison of keto & enol :→

- Mono keto form dominates over enol coz of strong C=O

mono keto form

enol (1.5×10^{-4} %)

-

keto - Ester

(8 %)

-

(30 %)

www.jeebooks.in

* All data are taken in liquid phase

(76.4 %)

di-keto

(89.2 %)

* Presence of phenyl ring will ↑ conj. in enol form.

• Effect of solvent on enol content :→

In case of water, enol content will be less, coz of stabalisation of keto form by extensive H-bonding.

• Order of enol content,

di-keto (cont. active methylene) > keto-ester > mono-keto

(5.6×10^{-3} %) (≈100 %)

(in order to minimise dipole-dipole repⁿ)

www.jeebooks.in

Q. Compare the enol content :→

1) (Aromaticity)

* 2) (Rep^n due to change in hyb.)

3) a > b

4)

9)

* 5) (large no. of bonds break)

10) (Fusion type enol)

6)

* 11) (rotation across bond → development of strain)

7)

8)

Q. Identify major enol form

www.jeebooks.in

* % enol is favoured by these factors,

i) Acidic H in keto form
ii) Aromaticity in enol
iii) Intramolecular H-bonding in enol
iv) Conjugation in enol
v) lesser repulsions / strain in enol

→ Identifying the major enol form

• In basic med., formation of carbanion is R.D.S. So forming the product with the stable carbanion is more favourable.

(Reddish brown)

* Structural Representation of 3-D molecules on Paper :→

• Representation is significant mainly when hyb. of 'C' is sp^3.

There are various type of representations

i) Wedge - Dash (Perspective) formula :

- grps on solid line lie on xy plane, grp at wedge position lie above xy plane i.e. towards the observer, grp at the dash position lies below the plane i.e. away from observer

www.jeebooks.in

- A given obj. or molecule can be represented in infinite ways.

-

-

-

-

Q. How many atoms can lie on one plane ?

a) CH_4 → 3

b) → 5

c) C_2H_2 → 4

d) C_2H_4 → 6

e) $H_3C-C\equiv C-D$ → 5

f) → 8

www.jeebooks.in

g) $D_2C=C=C=CD_2$ → 8

h)

→ 13

i) p- Xylene

→ 14

ii) Saw-horse projection :→

- We represent groups with the help of 'Y' & 'λ' shaped bonds.
- Two types of extreme shapes are possible,
  a) eclipsed : both Y or λ (same shape)
  b) staggered : one Y other λ

Eclipsed form

Staggered form

www.jeebooks.in

-

-

iii) Newman Projection :→

- This proj. represents side view of a molecule.
- Initially draw the shape of front & back bonds and finally insert the groups.

-

(L) (R)

-

(L)

-

www.jeebooks.in

In case of eclipsed form, rotate the back bonds slightly in clockwise or anticlockwise direction.

29/3/18

In case of heteroatom, take it as the front atom.

* Fisher Projection :-

- Horizontal lines & vertical lines are used in this prj.
- grps on HL lie above the plane, grps on VL lie below the plane.

www.jeebooks.in

-

H = HUG

-

-

★ Wedge - dash to Fisher :→

- Place your eye b/w wedge and dash so that two groups will come towards the observer and two away from observer.
- Groups coming towards obs. will form HL & grps going away from obs. will form VL.

-

-

www.jeebooks.in

•

•

•

- Fisher can be made by eclipsed form only.
  If staggered form is given then rotate accordingly.

•

★ Golden Rule : i) Max. 'C' should lie on the vertical line.

ii) 'C' containing f. grp. should lie on top of vertical line.

•

www.jeebooks.in

g.

www.jeebooks.in

31|3|18

Conformational Isomerism

→ conformational isomers (∞)
→ conformer (which we study)
→ not true isomerism
→ × π

- As e⁻ cloud of 'σ' bond is cylindrically symmetric so free rotation takes place without changing amount of orbital overlap.
- Infinite 3D forms which are formed during this process are conformational isomers.
- It is not possible across π-bond coz of restricted rotation.
- Specific conformational isomers which we study and analyse are conformers.
- They are not true isomers coz they readily inter convert and cannot be isolated under normal conditions.

While rotation two extreme forms are obtained
i) Eclipsed ii) Staggered

Vanderwaal's repⁿ (steric)

www.jeebooks.in

- Eclipsed is less stable than staggered due to two types of repulsions :
  - i) Vanderwaal rep^n (sterric rep^n) : it occurs due to rep^n b/w e^- clouds of interacting groups. It is directly proportional to size of group hence it is variable.
  - ii) torsional strain : it occurs due to b.p.-b.p. rep^n. It remains almost constant.

* Conformational Analysis :→

Q. Carry out C.A. of ethane about $C_1 - C_2$ bond rotation.

Ethane → $CH_3 - CH_3$ →

- Torsional strain dominates

www.jeebooks.in

→ Dihedral angle : It is the angle b/w two specified groups in newman proj. One at the front & other at back
If nothing is specified then consider the bulkiest groups of front and back.

→ Rotational / Energy Barrier : It is amt. of energy needed for rotation across a given bond for one mole of a compound.

*// Energy available at R.T. is 84 KJ/mol

- In P.E curve it is the difference b/w maxima & minima.
- It is energy diff. b/w least stable & most stable conformer.

Q. carry out conformational analysis of n-butane about C_2-C_3 bond rotation

→ $CH_3-\underset{②}{CH_2}-\underset{③}{CH_2}-CH_3$ →

Optical Isomerism

* Polarimeter experiment :

ATPSTAR, Gopal Square 3rd Floor, 89-90 Shrinathpuram, Sec.-A, Kota, Rajasthan 324010 Website : http://www.atpstar.com

www.atpstar.com

www.jeebooks.in

• Aim :

- To check the optical activity of the given substance.

• Optical Rotation : The angle by which P.P.L rotates is known as optical rotation.

• Two type of samples are possible,

i] Optically inactive compound : It fails to rotate p.p.l.
Symmetrical compds are optically inactive.
Achiral cmpds are optically inactive.

* Chiral → Cheir (hand) → unsymmetrical

Achiral → symmetrical

ii] Optically active compounds : They rotate the p.p.l. coz they are unsymmetrical.
Chiral compounds are optically active.
- Dextro & levo is determined experimentally.

• Optical isomers are pair of stereoisomers having different optical behaviour.

• Specific optical rotation is standard value of optical rotation for a given compound which is independent of length & concentration.

$$[\alpha]^{T/0}_{\lambda/D} = \frac{\alpha_{obs}}{l \cdot c}$$

2]

3]

4]

5] PO_4^{3-}

* Pro-Chiral Carbon :-

It is a type of carbon which is not chiral but converts to chiral centre when one of the group is changed

www.jeebooks.in

* Stereocentre :

- These are the centres due to which Stereoisomerism occurs.
- When a new stereoisomer is obtained after interchanging two groups on an atom then that center is stereocentre.

1]

2]

3]

4]

www.jeebooks.in

* Optical Activity / Chirality :

- These cmpds rotate the plane of P.P.L.
- Optically active cmpds are asymmetric. (chiral)
- Compound should not have P.O.S, C.O.S, A.A.OS
- Optical activity is not related to A.O.S.

www.jeebooks.in

* Important points to check optical activity :

i) compounds having exactly one chiral centre will always be optical active (OA).

ii) Most of cmpds having 0 CC are OIA (check POS, COS in Allene, spiro, phenyl).

iii) check POS, COS in case more than one chiral centre is present.

eg,

www.jeebooks.in

www.jeebooks.in

* Meso compound :→

- Meso compound is an optically inactive cmpd having at least two chiral centres.

* Meso compound is that optically inactive cmpd out of a set of stereisomers in which at least two are optically active.

www.jeebooks.in

* R-S configuration for chiral centres :-

Rectus Sinister

- R-S conf. is used to designate the arrangement of four groups around the chiral centre.
- L.P.G should be at dash, if L.P.G is at wedge then reverse the normal answer.
- If L.P.G lies on plane then use 3-grp rotation.

Rectus (R) ⇒ Clockwise
Sinister (S) ⇒ Anti-clockwise

1)

2)

* Optical Isomers :

- Optical isomers are pair of stereoisomers having diff. optical rotation.

1] ENANTIOMERS :

- They are pair of o.i. having equal & opp. optical rotation.
- They are non-superimposable mirror images of each other.
- It is only possible in assymetric object.

2] DIASTEREOMERS :

- They are pair of stereoisomers which are non-mirror images of each other.

R/S Method,

→ If R/S conf. same ⇒ they are same

If opp. R/S + asymmetric cmpd. ⇒ Enantiomer

Opp. R/S + symmetric cmpd ⇒ Identical / Meso

www.jeebooks.in

If R/S conf. neither same nor exactly opp. ⇒ Diastereomer.

www.atpstar.com

www.jeebooks.in

Set : 6, 7, 8, 9, 10, 11

* Method of Interchange :

		R/S
Odd pair interchange	→	opp.
Even pair interchange	→	Same

•

) (E)

•

) (D)

•

) (I)

* Chiral molecule / object : It is a molecule which is non-superimposable on its mirror image.

is a meso compound even if

coz overall it is O.I.A & contains

www.atpstar.com

www.jeebooks.in

- Enantiomers have same physical properties such as viscosity, R.I., boiling point, etc except the direc^n of optical rotation

- Diastereomers have different physical properties such as B.P., etc

- Enantiomers cannot be separated by fractional distillation becoz they have same boiling points.

* Racemic Mixture :

It is equimolar mixture of enantiomers. So, it is optically inactive.

It is inactive due to external cancelation whereas meso compound is inactive due to internal cancelation.

For eg,

5g (A) + 5g (B) {A & B are enantiomers}

It is represented as

10g (d, l)

OR

10g (±)

- Racemization :

It is a process in which racemic mixture is formed.

www.jeebooks.in

• Dextro & levo is not related to R & S.
R(+), S(−)
R(−), S(+)

* Optical Purity:

It is the % of enantiomeric mixture due to which optical rotation takes place.
In case single enantiomer exist in solⁿ then it is said to be enantiomerically pure or optically pure.

$$\% \text{ O.P.} = \frac{\text{excess of enantiomer}}{\text{total mixture}} \times 100$$

% O.P. + % Rac = 100%

Enantiomeric mixture can have two components.
i) % Optical purity
ii) % Racemization.

www.jeebooks.in

3. % O.P. = 40% (l) Calculate composition

→ % R = 60% ⇒ 30% (l) + 30% (d)
40% (l)
70% (l) + 30% (d)

7. Optically pure mandelic acid has optical rotation of +80°. Now that acid & its enantiomer are mixed & net rotation is found to be −20°. Find % of dextro & levo forms.

→ $x \times 80 + (x+y) \times -80 = -20$ $2x + y = 1$

$y = 1/4$ $\frac{3}{8} \times 100$

Amine Inversion & Optical activity :

When 'N' undergoes flipping (with chiral centre) enantiomeric pair is formed which interconverts so rapidly that they cannot be resolved in individual enantomers. So it is optically inactive.

While counting total stereoisomers, Nitrogen (undergoing flipping) is not taken as chiral centre.

www.atpstar.com

www.jeebooks.in

* JEE MAINS : STEREOISOMERISM ANALYSIS

- Active, inactive, chiral, achiral, rotate ppl.

* Erytho & Threo Isomers :

- It is an old term which is used to designate diastereomers.
- Mainly it is used for carbohydrates.
- It should not be expanded other type of compounds.
- It is valid for fisher proj.
- If two same grps are on same side of VL then it is Erytho isomer otherwise Threo.

www.jeebooks.in

14 Q.

1)

2)

3)

4)

www.atpstar.com

www.jeebooks.in

* D, L Notation :

- This notation is used in carbohydrates as well as amino acids.

In Carbohydrates,

- Initially it was thought that carbs were hydrates of carbon but it was partially true.
  $C_x(H_2O)_x$

  Glucose ⇒ $C_6H_{12}O_6$ But Acetic acid ⇒ CH_3COOH
  $C_6(H_2O)_6$ $C_2(H_2O)_2$
  Not carbohydrate.

- They must be,
  i) Polyhydroxy
  ii) Optically active
  iii) Aldoses / Ketoses

Our reference cmpd is D-glyceraldehyde. D/L is assigned randomly to glyceraldehyde.

D is decided w.r.t position of OH on lower most chiral centre. If OH on right ⇒ D otherwise L.

Cmpd should follow golden rule (max C atoms on VL)

It is not related to d/l.

www.jeebooks.in

- D-glucose & L-glucose are enantiomers.

In Amino Acids,

Amino Acids they contain NH_2 as well as COOH group.

Acidic ⇒ COOH > NH_2

Neutral ⇒ COOH = NH_2

Basic ⇒ COOH < NH_2

www.jeebooks.in

- Amino acids can be α, β, γ, etc. on the basis of relative position of NH_2 w.r.t. COOH.

- D/L is decided on the basis of position of NH_2 on the chiral centre. $NH_2 \Rightarrow$ right $\Rightarrow$ D
  $\Rightarrow$ left $\Rightarrow$ L

* Resolution of Racemic Mixture :

Separation of racemic mixture into its individual enantiomers is resolution of racemic mixture.

- Optically active compounds are resolvable coz they can form racemic mixture
